Sprint Burndown 1

Sprint Burndown 2

Spring Burndown 3

Reflection Questions

1. Did your estimations reflect the actual effort?

   Yes, the story point estimations reasonably reflected the expected effort. Simple tasks such as citizen registration were assigned fewer points, while technically complex tasks such as QR certificate verification received higher estimates. The estimates provided a useful way to compare the relative complexity of the user stories.

2. Was your backlog well-prioritized?

   Yes. The backlog was prioritized according to the importance of each feature to the core vaccination workflow. Registration, dose eligibility, and dose interval validation were given higher priority because they are essential for safely scheduling vaccinations. Certificate generation and slot management were assigned lower or medium priority where appropriate.

3. How did your simulated sprint align with your plan?

   The simulated sprint aligned well with the planned sprint structure. **Sprint 1** focused on the core vaccination workflow, including registration, eligibility checking, dose validation, and vaccination records. **Sprint 2** focused on QR certificates and vaccination centre slot management. This division also resulted in a balanced workload of **21 story points per sprint**.

4. What insights did the burndown chart give about your team's capacity?

   The burndown chart provided an indication of how quickly the team was completing the planned work during the sprint. It helped compare the remaining work against the expected sprint progress and showed whether the team was working at a sustainable pace. It can also help identify delays or unfinished tasks early so that future sprint capacity can be planned more accurately.
